

Q1. What is Utf 8?

Ans.- UTF-8 stands Unicode Transformation Format – 8 bit, which is the world's most common standard for encoding characters into digital data for electronic communication.

How UTF-8 works-

- Variable-length encoding – It uses between 1 to 4 bytes to represent different characters
- Single byte for basic text – Standard English letters, numbers, and basic symbols use just 1 byte.
- Multiple bytes for complex text- Other languages, special symbols, and emojis use 2 to 4 bytes.

Key features-

- Backward compatibility- Its first 128 characters match standard ASCII text completely meaning old ASCII files work without changes.
- Global support- It can display characters from nearly every written language in the world
- Web standard- It is the default character encoding for HTML 5 and powers over 90% of all webpages on the internet.

Q2. What are pros and cons of CSV and xlsx?

Ans- CSV (Comma-separated values) and XLSX (Microsoft Excel open XML spreadsheet) have following pros and cons.

CSV pros –

- Universal Compatibility
- Lightweight
- Programmatic friendly

CSV cons-

- No styling
- Single sheet only
- No formulas

XLSX pros

- Rich formatting
- Multiple Worksheets
- Advanced Calculations

XLSX cons

- Large File size
- Slower processing
- Software development
